The most prominent example is the HAZUS earthquake model, part of the Hazards U.S. Multi-Hazard (HAZUS-MH) software system. The earthquake model, which FEMA first released in 1997 and has since continually refined, employs sophisticated risk-assessment methodologies to estimate potential earthquake damage and losses.

Hazard. Seismic hazard levels differ significantly across the United States, both between and within states. To view the levels in your region, go to Earthquake Hazard Maps. These and other maps that depict earthquake hazard levels throughout the country are produced by the U.S. Geological Survey (USGS).

Determining your risk with regard to earthquakes, or more precisely shaking from earthquakes, isn't as simple as finding the nearest fault. The chances of experiencing shaking from an earthquake and/or having property damage is dependent on many different factors. The National Hazard Maps use all available data to estimate the chances of shaking (of different strengths and

A quantitative approach of the earthquake risk, in a long-term and large-scale sense, has been made for 23 distinct regions of Greece. The risk, R_i , in each region, i , has been determined as a convolution of earthquake hazard, buildings oldness coefficient, average population density and regional Gross Domestic Product per capita.
