Speed Control Of Dc Motor

Field Control of DC Series Motor. The speed of DC motor can be controlled by this method by any one of the following ways -. Field Diverter Method This method uses a diverter. Here the field flux can be reduced by shunting a portion of motor current around the series field.

Armature Control Method. With this method, the speed of the DC motor can be controlled by controlling the armature resistance to control the voltage drop across the armature. This method also uses a variable resistor in series with the armature.

What are the Best Ways to Control the Speed of DC Motor?

M2 is the motor whose speed control is required. M1 may be any AC motor or DC motor with constant speed. G is a generator directly coupled to M1. In this method, the output from the generator G is fed to the armature of the motor M2 whose speed is to be controlled.
