Stem Cell Research Inside Science

Stem cell: Stem cell, an undifferentiated cell that can divide to produce some offspring cells that continue as stem cells and some cells that are destined to differentiate (become specialized). Stem cells are an ongoing source of the differentiated cells that make up the tissues and organs of animals and plants.

Stem-cell therapy is the use of stem cells to treat or prevent a disease or condition.. Bone marrow transplant is the most widely used stem-cell therapy, but some therapies derived from umbilical cord blood are also in use. Research is underway to develop various sources for stem cells, as well as to apply stem-cell treatments for neurodegenerative diseases and conditions such as diabetes and ...

Due to the nature of embryonic stem cell research, there are a lot of controversial opinions on the topic. Since harvesting embryonic stem cells necessitates destroying the embryo from which those cells are obtained, the moral status of the embryo comes into question.

Adult stem cells (or Somatic Stem Cell): Stem cells that are harvested from tissues in an adult body. These cells are usually multipotent, meaning they can differentiate into cells from some, but not all, of the three germ layers. They are thought to act to repair and regenerate the tissue in which they are found in, but usually they can differentiate into cells of completely different tissue ...

Stem Cell Institute is one of the world's leading adult stem cell therapy and research centers. In close collaboration with universities and physicians world-wide, our comprehensive stem cell treatment protocols employ well-targeted combinations of allogeneic human umbilical cord stem cells and autologous bone marrow stem cells to treat diseases and conditions listed below.

Students consider the availability of stem cell therapies in countries with less stringent regulatory policies and procedures. From the perspective of various stakeholder groups they discuss whether scientists should collect and use data from patients who receive experimental treatments that don't meet the domestic ethical and scientific guidelines to which they are subject.

Glioblastoma stem cells (GSCs) are implicated in tumor neovascularization, invasiveness, and therapeutic resistance. To illuminate mechanisms governing these hallmark features, we developed a de novo glioblastoma multiforme (GBM) model derived from immortalized human neural stem/progenitor cells (hNSCs) to enable precise system-level comparisons of pre-malignant and oncogene-induced malignant ...

Dentures and implants may now be a thing of the past because scientists have the ability to grow new teeth in a patient's mouth. This is huge for the many adults who end up losing a tooth or multiple teeth during their lifetimes. As of now, the only options for a missing tooth include implants, [...]
